ADAPTIVE FILTERS

An adaptive filter is a system with a linear filter that has a transfer function controlled by variable parameters and a means to adjust those parameters according to an optimization algorithm.Because of the complexity of the optimization algorithms, almost all adaptive filters are digital filters.Adaptive filters are required for some applications because some parameters of the desired ...

Applications of Adaptive Filtering 5 In practical applications the measurement noise is unavoidable, and if it is uncorrelated with the input signal, the expected value of the adaptive-filter coefficients will coincide with the unknown-system impulse response samples. The output error will of course be the measurement noise (Diniz, 2008).

The least mean square (LMS) algorithm is widely used in applications to adaptive filtering due to its computational simplicity, unbiased convergence in the mean to the Wiener solution, and the existence of a proof of convergence in a stationary environment. Let $x(k) \in \mathbb{R}^{N \times 1}$ be the filter input, $d(k) \in \mathbb{R}$ the desired output.
