Map Interpretation for Structural Geologists exemplifies various topics, from deciphering topography using contour patterns to interpreting folds, faults, unconformities and dykes. By solving several types of maps, this book gives readers the confidence to solve difficult geologic questions related to map interpretation in the classroom and in the field. Interpreting geological and structural maps is an inseparable part of learning structural geology in the undergraduate curriculum and postgraduate development. Features approximately 30 full-color geological or structural maps and their solutions, from basic to the most complex Includes content appropriate for undergraduate and graduate students and professional geoscientists alike Presents a self-learning guide and teaching manual with minimum instruction required

The Geological Society of London was founded in 1807. At the time, membership was restricted to men, many of whom became well-known names in the history of the geological sciences. On the 21 May 1919, the first female Fellows were elected to the Society, 112 years after its formation. This Special Publication celebrates the centenary of that important event. In doing so it presents the often untold stories of pioneering women geoscientists from across the world who navigated male-dominated academia and learned societies, experienced the harsh realities of Siberian field-exploration, or responded to the strategic necessity of the 'petroleum girls' in early American oil exploration and production. It uncovers important female role models in the history of science, and investigates why not all of these women received due recognition from their contemporaries and peers. The work has identified a number of common issues that sometimes led to original work and personal achievements being lost or unacknowledged, and as a consequence, to histories being unwritten.

Interpreting structural geological maps is an inseparable part of learning structural geology in undergraduate curriculum and postgraduate development. Map Interpretation for Structural Geologists provides instruction on various topics from deciphering topography from contour patterns to interpreting folds, faults, unconformities, and dykes. By solving several types of questions, this book gives readers the confidence to solve complex geological questions in the classroom and the field. Features around 30 full color maps and their solutions, from basic to the most complex geological maps Presents a self-learning guide & teaching manual Appropriate for both undergraduate and graduate students, and professional geoscientists

The last thorough revision of Rutley's Elements of Mineralogy appeared as the 23rd Edition in 1936. In subsequent editions, an effort to keep abreast with the great progress in the science was made by small (and often awkward) modifications and, especially, by the addition of an independent chapter on the atomic structure of minerals. For this present edition, the complete re-setting of the book has made possible not only the integration of the added chapter on atomic structure into its proper place in the accounts of the chemical and physical properties of minerals, but also extensive rewriting and rearrangement of the material in the first part of the book. To this part, also, has been added a short chapter on the classification of minerals. In the second part, the Description of Minerals, numerous, if not so extensive, modifications and modernisations have been introduced. A couple of dozen new figures have been added, mostly in the early part of the book. More specifically, the major changes in this new edition are the following. The electronic structure of atoms supplies the guide lines for the whole account of mineral-chemistry; additional items concern the electrochemical series, of interest in the occurrence and metallurgical treatment of ores, and chemical analysis. On the physical side, the dependence of physical properties of minerals on their atomic structure is emphasized and, in addition, a brief account of radioactivity and isotopic age-determination is given.
