Building services play a central role in contributing to the design of a building, not only in terms of overall strategies and standards to be achieved, but also in façade engineering, the weights, sizes and location of major plant and equipment, the position of vertical service risers, routes for the distribution of horizontal services, drainage, energy sources, sustainability, and so on.

As buildings are responsible for over 40% of all energy consumption, sustainable design is now top of the regulatory and corporate agenda. Working as part of a team we are able to balance our client’s aspirations with engineering (and often budgetary) constraints, to design high performance, low energy building systems.

Building services refers to the equipment and systems that contribute to controlling the internal environment to make it safe and comfortable to occupy. They also support the requirements of processes and business functions within buildings, for example manufacturing and assembly operations, medical procedures, warehousing and storage of materials, chemical processing, housing livestock, plant cultivation, etc. For both people and processes the ability of the building services engineering systems to continually perform properly, reliably, effectively and efficiently is of vital importance to the operational requirements of a building. Typically the building services installation is worth 30-60% of the total value of a contract, however existing publications on design management bundles building services engineering up with other disciplines and does not recognise its unique features and idiosyncrasies. Building Services Design Management provides authoritative guidance for building services engineers responsible for the design of services, overseeing the installation, and witnessing the testing and commissioning of these systems. The design stage requires technical skills to ensure that the systems are safe, compliant with legislative requirements and good practices, are cost-effective and are coordinated with the needs of the other design and construction team professionals. Covering everything from occupant subjectivity and end-user behaviour to design life maintainability, sequencing and design responsibility the book will meet the needs of building services engineering undergraduates and postgraduates as well as being an ideal handbook for building services engineers moving into design management.

Building Services, Technology and Design provides a concise guide to the installation and design of principal services in domestic and commercial buildings. It covers the level 2 module of The CIOB's Education Framework and is officially sanctioned by the CIOB as the recognised text for that module. The book combines theory, design and application in one volume and is supported throughout with illustrations, design examples, tables and charts. Services covered include: cold and hot water; heating; ventilation; air conditioning; gas; electricity; security; fire control; sanitation; drainage and transport systems. Building Services, Technology and Design is a core text for the CIOB level 2 module, as well as BTEC HNC/D building studies and degree courses in building. It is also an essential reference for all members of the facilities management and construction industry.

Approaches this increasingly complex and evolving sector from the different perspectives of key stakeholders. Covers a diverse range of core themes, from managing design information to cultural issues.

Building Services Design Methodology clearly sets out and defines the building services design process from concept to post-construction phase. By providing a step-by-step methodology for students and practitioners of service engineering, the book will encourage improved efficiency (both in environmental terms and in terms of profit enhancement) through better project management. Generic advice and guidance is set in the current legal and contractual context, ensuring that this will be required reading for professionals. The book's practical style is reinforced by a number of case studies.

Intelligent buildings provide stimulating environments for people to work and live in. This book brings together a body of the latest knowledge about design, management, technology and sustainability set against the background of developments in the cultural landscapes, which affect those living and working in buildings.

This book contains a framework and its appendices for building services installation works. Principles outlined in the model for management include work breakdown structure, quality function deployment, dependency structure matrix, and value management. The framework that is intended for use by building services consultants for effective design management can easily be adopted for other professionals within the built environment. The appendices outline roles and responsibilities during the design management process.

Design Project Management is a guide to contracting and working with designers, and managing design projects proactively through to successful completion. It provides guidance for clients on simultaneously optimizing the business outcome and the creative opportunity of a design project by getting the best from a design project team through leadership, team building, mutual understanding and good communication. It also gives professional guidance to design and architecture students, and can help design consultants to ensure that they and their clients are doing everything right. Griff Boyle takes you through the whole design project from setting business objectives and design parameters, preparation of briefing documentation, shortlisting design consultants and evaluating concept design proposals and fees, to preparing forms of appointment and assembling in-house and 'external' project teams. The author explains how best to establish and meet project objectives, select works contractors and sub-contractors, and administer tenders and contracts. Advice on balancing and monitoring costs and resources, progress and financial reporting, and change control mechanisms is also given. To highlight typical problems and their solutions the author quotes case study examples from interiors, exhibition, refurbishment and multidisciplinary projects. Public and private sector managers involved in building services, retail, leisure, exhibition and office schemes will find this book saves them time and money, whether or not they have an in-house design team.

A practical handbook on the management of building design, this guide explains the processes, roles and responsibilities of those involved in the design of the building, as well as ways to maximise efficiency. Well structured and easy to read, the book includes useful notes and checklists on, for example, how to select a design team and how to organise and plan the design process. The authors are recognised authorities in the field of project management, based at an internationally renowned department. Their book will prove invaluable to both students and practitioners in project management. \*Contains many checklists, tables and examples etc. which make it useful to both students and practitioners. \*Teaches the reader how to maximise efficiency in design management. \*Concise and factual handbook.
