Obstetrical brachial plexus injury (OBPI) is an injury in newborns, thought to be sustained during labour and delivery. 1 Incidence is estimated to be between 1.6 and 2.6 in 1000 births, 2 equivalent to autism 3 and congenital deafness. 4 It is greater than for type 1 diabetes mellitus 5 and cystic fibrosis. 6 Shoulder dystocia is the main risk factor; others are related to fetal size and presence of comorbid birth trauma. 7 Clinical presentation immediately following delivery is consistent ...

Obstetrical brachial plexus injury (OBPI): Canada's ...

Obstetric brachial palsy following breech delivery is a typical group: upper lesions predominating with a great number of upper root avulsions and phrenic nerve lesions. In some cases spontaneous nerve recovery is insufficient and further treatment is considered in the first months of the infant's life.

Obstetric Brachial Plexus Injuries Following Breech ...

Obstetric brachial plexus injury is the flask paralysis of the arm, which emerges from a difficult birth. This results from the damage to the nerves from the C5 cervical root to T1. Following brachial plexus injury, movement impairment, a decrease in the joint range of motion, muscle contractures, motor disorders related to muscle weakness, and the loss of functional movements are commonly ...

The Effects of Virtual Reality Patients With Obstetric ...

Despite the name, brachial neuritis (lateral amyotrophy, Parsonage-Turner Syndrome) is not usually treated by the brachial plexus injury service. Patients with suspected brachial neuritis are frequently referred to our consultant team. In the majority of these cases treatment is not possible within the brachial plexus service and only general therapeutic advice can be given. Surgery has a limited role in management of this condition.
